

Task Description-1

Zero-shot:

Prompt AI with only the instruction. Write a Python function to determine whether a given number is prime

```
import math

def is_prime(n: int) -> bool:
    """Return True if n is a prime number, False otherwise."""
    if n < 2:
        return False
    if n % 2 == 0:
        return n == 2
    r = math.sqrt(n)
    for i in range(3, r + 1, 2):
        if n % i == 0:
            return False
    return True
```

Task Description-2

One-shot:

Provide one example: Input: [1, 2, 3, 4], Output: 10 to help AI generate a function that calculates the sum of elements in a list.

```
def sum_list(nums: list[int]) -> int:
    """Return the sum of elements in nums."""
    return sum(nums)

# One-shot example
print(sum_list([1, 2, 3, 4])) # Output: 10
```

10

Task Description-3

Few-shot:

- Example 1: Input: "abc123xyz" Output: "123"
- Example 2: Input: "order56id78" Output: "5678"
- Example 3: Input: "room9floor4" Output: "94"

to create a function that extracts digits from an alphanumeric string.

```
def extract_digits(s: str) -> str:
    """Return concatenated digits from alphanumeric string s."""
    return ''.join(ch for ch in s if ch.isdigit())

# Examples
print(extract_digits("abc123xyz")) # "123"
print(extract_digits("order56id78")) # "5678"
print(extract_digits("room9floor4")) # "94"
```

123
5678
94

Task Description-4

Compare zero-shot vs few-shot

prompting for generating a function that counts the number of vowels in a string.

zero-shot

Generate a function that counts the number of vowels in a string.

Few-shot:

- Example 1: Input: "hello world" Output: 3
- Example 2: Input: "Copilot rocks" Output: 4
- Example 3: Input: "Artificial Intelligence" Output: 9

Generate a function that counts the number of vowels in a string.

```
def count_vowels(s: str) -> int:
    vowels = "aeiouAEIOU"
    count = 0
    for char in s:
        if char in vowels:
            count += 1
    return count

# Example usage:
print(count_vowels("Hello World")) # Output: 3

def count_vowels(s: str) -> int:
    vowels = set("aeiouAEIOU") # include both lowercase and uppercase
    return sum(1 for char in s if char in vowels)

# Test cases
print(count_vowels("hello world"))      # Output: 3
print(count_vowels("Copilot rocks"))     # Output: 4
print(count_vowels("Artificial Intelligence")) # Output: 9
```

```
3
3
4
10
```

Task Description-5

Use few-shot prompting with 3 sample inputs to generate a function that determines the minimum of three numbers without using the built-in min() function.

```
def min_of_three(a: float, b: float, c: float) -> float:
    """Return the minimum of three numbers without using min()."""
    smallest = a
    if b < smallest:
        smallest = b
    if c < smallest:
        smallest = c
    return smallest

# Examples
print(min_of_three(5, 8, 3))    # Output: 3
print(min_of_three(12, 7, 9))    # Output: 7
print(min_of_three(4, 4, 10))    # Output: 4

# Given input
print(min_of_three(15, 20, 11)) # Output: 11
```
